

# MANAGEMENT INFORMATION SYSTEMS

School of Business Administration  
[www.aus.edu/sba](http://www.aus.edu/sba)

Management information systems (MIS) entails analyzing, designing, developing, implementing, maintaining and managing the computer-based information systems of public and private organizations. This program is a combination of business and technology. Students learn how to use information technology and computing resources to solve business problems. This is achieved by determining an organization's technical needs and then creating and applying appropriate solutions using software packages. Students will also learn how to monitor and control various phases of large software projects, explore fintech and e-commerce, learning about cryptocurrencies and mobile payments, create your own apps, build models for business analytics and eye-catching data visualizations.
